EDUCATION

Ozyegin University

Sep 2020 - Jul 2026

B.Sc Computer Science, Faculty of Engineering

SKILLS

Languages: English (Fluent), Arabic (Native), Turkish (Intermediate)

Programming Languages: Python, Java, C++, SQL

Backend & Frameworks: Spring Boot, JPA/Hibernate, RESTful API design, JUnit, Mockito, MockMvc

Data & Analytics: Google Tag Manager (GTM), Meta Conversions API (CAPI), data layer architecture, event tracking

Tools & Platforms: Docker, Git, Linux, MySQL PostgreSQL, OMNeT++

Concepts: REST API design, unit & integration testing, layered/backend architecture, version control workflows

PROFESSIONAL EXPERIENCE

Data Analytics Intern — Daam Al-Arabia

Jul 2024 – Aug 2024

- Developed custom Google Tag Manager code to integrate server-side event tracking with the Meta Conversions API (CAPI), improving reliability of conversion data used for measurement reporting.
- Implemented structured data layer architecture for web event tracking, increasing analytics accuracy across key user interactions.
- Partnered with the measurement strategy team to define tracking requirements and event specifications for digital analytics implementations.

Customer Relations Intern — Abdul Latif Jameel Motors – Toyota

Jan 2020 – Mar 2020

- Tracked and coordinated inventory across a high-volume auto parts department, maintaining accurate stock levels and on-time order fulfillment.
- Resolved customer part requests as a front-line point of contact, coordinating with warehouse and sales teams to reduce customer wait times.

PROJECTS

B-HUNT — Decentralized IoT Trust Management Framework

- Designed and built a decentralized IoT trust management framework featuring blockchain-anchored evidence, smart contract-based flagging, and a bounty-hunting investigation layer with credibility-weighted validator consensus.
- Achieved 93% attack detection with 0% false positives across 450 simulation runs covering packet-drop, on-off, ballot-stuffing, and corrupt-validator attack scenarios.
- Introduced service-specific trust vectors to detect targeted attacks missed by traditional scalar trust models; work targeted for IEEE publication and evaluated by a four-professor panel at Ozyegin University.

Car Rental Management System — Java, Spring Boot, JPA, MySQL

- Built a full-stack car rental management system with a RESTful API supporting car search, reservations, and equipment/service add-ons.
- Designed a layered backend architecture backed by MySQL to manage car inventory, reservations, and rental status.
- Wrote unit tests (JUnit, Mockito) for all service-layer logic and integration tests for API endpoints using Spring Boot's MockMvc.

Automata Practice and Test — Interactive Canvas Feature — Java, GUI

- Designed and implemented a graphical canvas editor for a Java-based automata theory tool, replacing hand-written text definitions with a visual create/edit/delete interface for DFA, NFA, PDA, and TM diagrams.
